

Sub
BS

17. (New) A computer system for collaborative browsing by a first computer with a first display and a second computer with a second display, through a control site computer, the first computer, the second computer, and the control site computer being coupled to a network, the system comprising:

a selector for selecting a region of the first display;

a capture device for capturing an image associated with the region;

a first transmitter for transmitting the image to the control site computer;

a control site receiver for receiving the image at the control site computer;

a second transmitter for transmitting the image received by the control site receiver to the second computer;

a second receiver for receiving the image transmitted by the second transmitter to the second computer;

wherein the second computer displays the image received by the second receiver on the second display.

18. (New) The system of claim 17, wherein the capture device uses a combination of keystrokes to initiate capture of the image of the region.

AK

19. (New) The system of claim 17, wherein the computer network is the Internet.

20. (New) The system of claim 19, wherein the selected region is converted into an image file format before transmission of the image to the control site computer.

21. (New) The system of claim 17, wherein the capture device automatically refreshes the image associated with the region, and the first transmitter automatically retransmits the refreshed image to the control site computer.

22. (New) The system of claim 21, wherein the first transmitter automatically retransmits the changes in the refreshed image and does not retransmit the entire refreshed image.
